Document Information

Edition: Public showcase 1.0
Date: October 2026
Content: fictional demonstration data
Format: A5 pages arranged as A4 spreads
License note: adapt the text, palette, and assets for your own project

This document explains the design system while demonstrating it. Names, links, locations, and procedures are illustrative only.

The Design System

Main title: 30 pt

Chapter titles use Arial Bold at 30 pt with a 43 pt line height. They sit at the top of the content area and establish the strongest level in the hierarchy. A chapter may begin on an odd page so that major sections consistently open on the right-hand side of a printed booklet.

Section titles use Arial Medium at 16 pt with a 25 pt line height. Body text uses Arial Regular at 12.5 pt with a 23 pt line height. Paragraphs are justified and receive 18 pt of space after each paragraph. These values are controlled globally in content/theme.toml.

Page geometry and rhythm

The page system uses a small number of shared rules instead of positioning every item manually:

- Each logical page is A5 portrait; two pages are composed into one A4 landscape spread
- Inside and outside margins differ so facing pages feel balanced after binding
- Sections normally begin 5 mm after the preceding block; semantic relationships select other predictable gaps
- Chapter accent colors identify sections through corner markers, bullets, and selected diagrams
- Bullet spacing responds to the number of wrapped lines instead of using a fixed row height
- Content is moved to the next page when the remaining space cannot accommodate it cleanly

Semantic spacing keeps recurring relationships consistent. Use an explicit one-off override only when a genuinely exceptional composition requires it.

Optional audience marker

A small edge icon can mark content intended for a particular audience. The symbol, size, and offset are theme settings, so a project can replace it with its own icon or omit it entirely.

Reusable Content Modules

Text blocks

A text block contains an optional subtitle followed by one or more paragraphs. It is the default choice for explanatory material and requires no layout instructions beyond the content itself.

Keep paragraphs focused. When a topic becomes procedural or scannable, switch to bullets, routing rows, a highlighted statement, or a link module rather than forcing everything into prose.

Bullet lists

- Short items use the standard bullet style for quick scanning
- Grouped items can combine a bold lead-in with supporting detail
- Numbered steps are available when sequence is essential

Routing rows

Use routing rows when readers need to map a question, topic, or task to a destination.

Where should this content live?

- Shared visual values → theme.toml
- Book metadata → book.toml
- Page copy → chapters/
- Images and icons → assets/

Repository or shared-file link

This module combines an icon, a navigation path, a file-name, and a clickable link. Replace the icon and labels to represent GitHub, a shared drive, an intranet, or another document store.

Shared Files

Repository → content → chapters → 02-content-modules.toml

Image-and-list template

A compact module for introductions, checklists, or any pattern that combines a square image with a short list.

- Replace the placeholder
- Keep each point concise
- Let the planner position it

People and Profiles

Alternating profile cards

People cards alternate the portrait between the outer and inner edge. Names, roles, rooms, pronouns, or contact details can occupy the secondary line. The square portraits shown here are placeholders and can be replaced without changing the layout.

Training & Education

For a public repository, use fictional names and licensed or generated portraits. Keep real personal data in a private content layer rather than in the template itself.

Links, QR Codes, and Images

Choosing a QR layout

Place longer explanations above the QR code at full column width. Reserve the side-by-side module for a short prompt, so the text remains readable and the code retains a comfortable scanning size.

Side-by-side QR module

Use this compact arrangement when one or two short sentences are enough.

Example link

Stacked QR module

Longer explanations use the full text width first, followed by a centered QR code and caption. This keeps narrow columns from producing excessive line breaks and distributes content more evenly across the page.

Image behavior

Images can be placed in the normal reading flow or at explicit page coordinates for decorative compositions. Flow images are safer for editable content because later sections automatically move when the image dimensions change.

Editing the Booklet

Content-first workflow

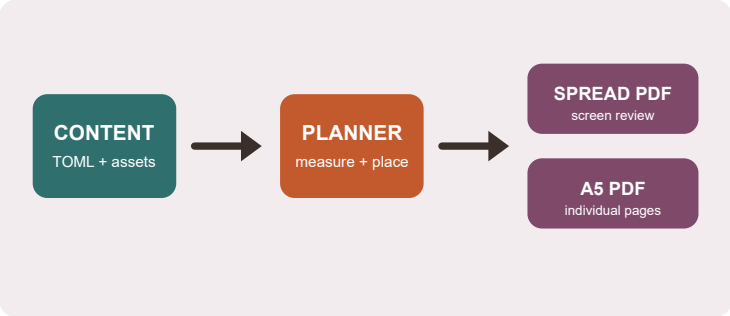

Most updates should require editing only a TOML content file. Add a chapter file, choose a supported section type, supply the text and assets, then run the build. The planner measures the content, distributes it over pages, and generates the table of contents.

The visual implementation lives separately in Typst. That separation allows non-design edits to remain small and predictable while advanced users can still extend the component library.

For a small content change

- Edit the relevant file in content/chapters
- Use relationship labels such as attached, continuation, related, relaxed, or spacious only when the semantic connection matters
- Run the build to create both the spread PDF and the A5 print PDF
- Inspect the changed pages and their neighbors
- Adjust a global range before introducing a one-off exception

Project structure

A good template makes the common edit easy, the exceptional edit possible, and every output verifiable.
